Airport Noise Management System Monthly Report
Report Descriptions

Background

Installed in 1996, the Airport Noise Management System (ANMS) enables the City of Chicago to monitor the amount of noise being generated over the communities surrounding Chicago O'Hare International Airport (O'Hare) by the aircraft operating at the Airport. The ANMS collects, analyzes and processes data from a number of sources of information including a network of 36 noise monitors around O'Hare, Federal Aviation Administration (FAA) radar data, weather data, and noise complaints. Over 150,000 flights and 400,000 noise events are recorded by the ANMS each month for the Chicago Department of Aviation (CDA). The CDA and the O'Hare Noise Compatibility Commission (ONCC) utilize data from the ANMS to facilitate the development and management of noise abatement programs at the Airport. The following reports summarize pertinent monthly information from that data concerning the noise levels and operations at the Airport.

Aircraft Operations Summary

The chart below illustrates the trend in monthly aircraft operations at O'Hare. Total monthly operations are based on the FAA's Air Traffic Activity Data System (ATADS).

Aircraft Operations by Month										
Month	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**	**2021**

Aircraft Fleet Mix Report

The *Aircraft Fleet Mix Report* summarizes the number and type of aircraft operating at O'Hare during all hours of the day and during the nighttime hours. In 1990, Congress passed the Airport Noise and Capacity Act (ANCA) to create a more comprehensive method for regulating aircraft noise. ANCA tasked the FAA with establishing a national noise policy, as well as substituted advances in "quiet engine" technology for restrictions on airport operations. These aircraft noise standards are codified in FAA Part 36 regulations, "Noise Standards: Aircraft Type and Airworthiness Certification." Aircraft must meet Part 36 standards to receive "type" or "airworthiness" certificates to operate in the United States. There are five stages of noise standards for aircraft: Stage 1, Stage 2, Stage 3, Stage 4, and Stage 5. Currently, all aircraft operating at O'Hare and within the United States are Stage 3 or 4. These aircraft, such as the Airbus A320 and new Boeing 737's (B737), use a quieter type of engine that significantly reduces noise at the source. Stage 5 noise standards will apply to new aircraft designed, manufactured, and certificated after December 31, 2017.

Wind Summary

Wind is a key factor influencing runway use and operation. Aircraft performance requirements make it necessary for aircraft to take off and land into the wind for safety purposes. Ideally, aircraft should take off and land into the wind as the increased airflow over the wings provides improved lift. The diagram to the right summarizes the percent of wind occurrences by direction based on hourly data from the KORD Automated Surface Observing System (ASOS), which is a joint effort of multiple government agencies.

Runway Use Report

O'Hare has eight runways that are all utilized at different times depending primarily upon the prevailing wind conditions on the airfield, as well as any runway maintenance.

The *Runway Use Report* presents the average percentage of use for each runway for the current month, the previous month, and a 12-month average. The percentage of use for departures and arrivals is shown graphically for each runway. This data is for daytime hours (7 a.m. to 10 p.m.) and for all aircraft types. Also shown is the runway use for nighttime hours (10 p.m. to 7 a.m.). Percentage is a ratio whereas a percentage point (pp) is the difference between two percentages.

Departures
Most used departure runway: **28R – 43%**
28R departures increased by **7pp** from March 2021
10L departures decreased by **4pp** from March 2021

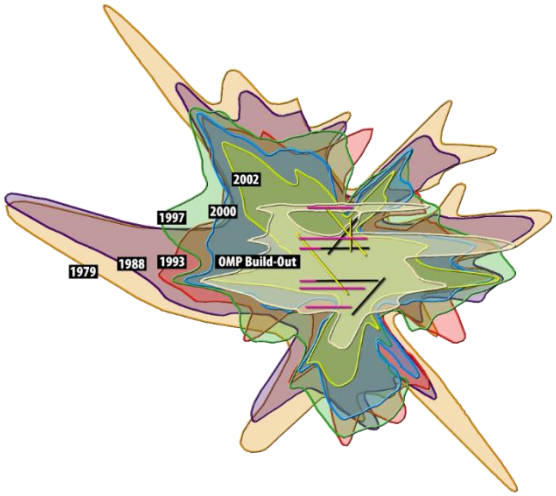
Arrivals
Most used arrival runway: **28C – 30%**
28C arrivals increased by **5pp** from March 2021
10C arrivals decreased by **4pp** from March 2021

At O'Hare, the primary runways face east to west. In east flow, aircraft depart the primary runways to the east; arriving aircraft approach from the west. Conversely, in west flow, aircraft depart the primary runways to the west and arrivals come from the east.

Due to prevailing winds, the FAA Air Traffic Control Tower can sometimes use the same runways for an extended period of time. At times one may notice a shift in the way airplanes fly over an area, and this is usually because the "flow" of air traffic has changed and different runways are in use. The above graphic represents the percentage difference between the two primary "flows" during the current month.

Aircraft Noise Report

The *Aircraft Noise Report* summarizes noise measurements from each of the 36 permanent noise monitors located around the Airport. The data presented summarizes the Day-Night Average Sound Levels (DNL's). DNL is a 24-hour time-averaged sound exposure level with a 10 decibel (dB) nighttime (10 p.m. to 7 a.m.) weighting to account for the lower background noise levels during the nighttime hours. The dataset for the current month includes 1,009 monitor-days out of a possible 1,080 monitor-days (93%).



The data display the measured aircraft DNL for each month and a comparison to the same month of the previous year, and compare the current month to the 12-month average. The aircraft noise report identifies noise from the existing aircraft operations at O'Hare. The modeled values for each monitor are shown for 1997, 2000, and the OMP Build-Out Noise Contours. The aircraft noise levels for each monitor vary from month to month. This is primarily due to runways being utilized differently under changing wind conditions.

The modeled 65 DNL noise contour at O'Hare has shrunk in size consistently since 1979 (right) despite an increase in total aircraft operations because of the replacement of Stage 1 and 2 aircraft, mandated by ANCA, with Stage 3 and Stage 4 aircraft.

Noise Complaint Report

The CDA maintains a toll-free noise hotline (1-800-435-9569), an online service at www.flychicago.com/oharenoise, and a free CHI 311 mobile app for citizens to express their concerns about particular aircraft events or aircraft noise levels in general. In February 2015, a citizen group created a software script to register aircraft noise complaints via the City of Chicago's 311 site. In January 2018 the City of Chicago implemented a captcha to improve the performance of its 311 system by reducing the number of non-human submissions. On December 19, 2018, the City of Chicago launched a new software platform for service requests of all types, including aircraft noise complaints. This new platform includes multiple methods to submit a complaint including telephone, Internet, and the free CHI 311 mobile app.

The *Noise Complaint Report* summarizes the number of complaints received from households with verifiable addresses and where the households were located. The tables illustrate the method of complaints, nature of complaints, and time of complaints during the specified month. The chart below illustrates the trend in monthly complaints. These totals only include complaints made within the State of Illinois to the O'Hare Noise Hotline toll-free number, online service, or CHI 311 mobile app. Data for noise complaints made prior to December 18, 2018, is available on the CDA's website at www.flychicago.com/oharenoise.

Complaints by Month			
Month	**2019**	**2020**	**2021**
January	--[1]	32,071	15,713
February	--[1]	27,588	10,326
March	10,790	31,610	20,017
April	6,732	14,676	**24,796**
May	16,367	15,212	
June	29,934	13,873	
July	37,821	18,970	
August	52,114	20,485	
September	45,407	22,284	
October	36,399	15,385	
November	30,691	16,346	
December	31,935	17,211	
Total	**298,190**	**245,711**	**70,852**

Note 1: Complaints for January 1, 2019 through February 28, 2019 are not included due to migration to the new 311 software platform.

-- Data unavailable. n/a - Not Applicable

1. **Red** represents an increase of 1 dB or more from the same month of the previous year (15 monitors). **Green** represents a decrease of 1dB or more from the same month of the previous year (0 monitors).
2. **Red** represents an increase of 1 dB or more from the modeled 1997 noise contour level (0 monitors). **Green** represents a decrease of 1dB or more from the modeled 1997 noise contour level (13 monitors).
3. The following 9 monitor-days were excluded due to high community noise values: Site 27 (12,24); Site 28 (5,13); Site 29 (10,16); Site 32 (5); Site 34 (9); Site 44 (16).
4. The following 31 monitor-days were not available due to malfunction: Site 22 (all); Site 44 (1).
5. Data is included for all days where data is collected for greater than 90% of the day.
